Roy van Driesche, Mark Hoddle, Ted Center : Control of Pests and Weeds by Natural Enemies: An Introduction to Biological Control before purchasing it in order to gage whether or not it would be worth my time, and all praised Control of Pests and Weeds by Natural Enemies: An Introduction to Biological Control:

Biological control utilizing a population of natural enemies to seasonally or permanently suppress pests is not a new concept. The cottony cushion scale, which nearly destroyed the citrus industry of California, was controlled by an introduced predatory insect in the 1880s. Accelerated invasions by insects and spread of weedy non-native plants in

the last century have increased the need for the use of biological control. Use of carefully chosen natural enemies has become a major tool for the protection of natural ecosystems, biodiversity and agricultural and urban environments. This book offers a multifaceted yet integrated discussion on two major applications of biological control: permanent control of invasive insects and plants at the landscape level and temporary suppression of both native and exotic pests in farms, tree plantations, and greenhouses. Written by leading international experts in the field, the text discusses control of invasive species and the role of natural enemies in pest management. This book is essential reading for courses on Invasive Species, Pest Management, and Crop Protection. It is an invaluable reference book for biocontrol professionals, restorationists, agriculturalists, and wildlife biologists. Further information and resources can be found on the Editors own website at: www.invasiveforestinsectandweedbiocontrol.info/index.htm
